[Stopped v. Deallocated VMs](#)

```
# You have to use -force to have the VMs enter a deallocated state
# Resourcegroupname is optional. Remove and it will stop all VMs
# Stopping the VM in the portal also sends VM to a deallocated state
# Shutting down from the VM does not deallocate and compute charges will continue
# USING the command below WITHOUT the -force will leave the VM allocated.
# Deallocation unassigns public and private IP, meaning, booting back up will
change the IP assignments.
```

```
Get-azvm -resourcegroupname demo-rg | stop-azvm -force
```
